# Reduction ratio of the IS-algorithm: worst and random cases 

Vincent Jugé

Université Gustave Eiffel (LIGM)

28/06/2022

## Contents

(1) Induced-sorting algorithm for computing the suffix array of a word
(2) Worst-case reduction ratio
(3) Average reduction ratio: Letters generated by a nice Markov chain
(4) Number of recursive calls: Letters generated by a finite Markov chain

## Suffix arrays ${ }^{[1]}$

Suffix array: permutation that orders lexicographically suffixes of a word

$$
\begin{array}{lllllllll}
B & A & L & A & L & A & I & K & A
\end{array}
$$

## Suffix arrays ${ }^{[1]}$

Suffix array: permutation that orders lexicographically suffixes of a word

$$
\begin{array}{llllllllll}
\text { B } & \text { A } & \text { L } & \text { A } & \text { L } & \text { A } & \text { I }
\end{array}
$$

| A |  |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| K | A |  |  |  |  |  |  |  |
| I | K | A |  |  |  |  |  |  |
| A | I | K | A |  |  |  |  |  |
| L | A | I | K | A |  |  |  |  |
| A | L | A | I | K | A |  |  |  |
| L | A | L | A | I | K | A |  |  |
| A | L | A | L | A | I | K | A |  |
| B | A | L | A | L | A | I | K | A |

## Suffix arrays ${ }^{[1]}$

Suffix array: permutation that orders lexicographically suffixes of a word

| A |  |  |  |  |  |  |  |  |

Useful for longest common factors, Burrows-Wheeler transform ${ }^{[2]}, \ldots$

Induced-sorting (SA-IS) algorithm ${ }^{[3]}$
Goal: Computing the suffix array of a word $w$ with letters in $\{0,1, \ldots,|w|\}$ or in a finite alphabet

$$
\begin{array}{lllllllll}
B & A & L & A & L & A & I & K & A
\end{array}
$$

(0) If no symbol of $w$ occurs twice, just sort them

Induced-sorting (SA-IS) algorithm ${ }^{[3]}$
Goal: Computing the suffix array of a word $w$ with letters in $\{0,1, \ldots,|w|\}$ or in a finite alphabet
(0) If no symbol of $w$ occurs twice, just sort them
(1) Append a $\$$ symbol (minimal symbol) to $w$

Induced-sorting (SA-IS) algorithm ${ }^{[3]}$
Goal: Computing the suffix array of a word $w$ with letters in $\{0,1, \ldots,|w|\}$ or in a finite alphabet
B $\quad A \quad L \quad A \quad L \quad A \quad I \quad K \quad A \quad \$$

A L A
A L A
A I K A \$
(0) If no symbol of $w$ occurs twice, just sort them
(1) Append a $\$$ symbol (minimal symbol) to $w$
(2) Subdivide $w \cdot \$$ into unimodal (LMS) factors

## Induced-sorting (SA-IS) algorithm ${ }^{[3]}$

Goal: Computing the suffix array of a word $w$ with letters in $\{0,1, \ldots,|w|\}$ or in a finite alphabet

B A L A L A I K A \$

| 1 | A | L | A |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 1 |  |  |  | $A$ | L | A |  |  |  |  |
| 0 |  |  |  |  |  | A | I | K | A | S |

- If no symbol of $w$ occurs twice, just sort them
(1) Append a $\$$ symbol (minimal symbol) to $w$
(2) Subdivide $w \cdot \$$ into unimodal (LMS) factors
- Sort these and relabel them in increasing order

(gives you $w^{\prime}$ )

## Induced-sorting (SA-IS) algorithm ${ }^{[3]}$

Goal: Computing the suffix array of a word $w$ with letters in $\{0,1, \ldots,|w|\}$ or in a finite alphabet

| 1 |  | $A$ | $L$ | $A$ |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 1 |  |  |  | $A$ | $L$ | $A$ |  |  |  |  |
| 0 |  |  |  |  |  | $A$ | I | K | A | S |

(0) If no symbol of $w$ occurs twice, just sort them
(1) Append a $\$$ symbol (minimal symbol) to $w$
(2) Subdivide $w \cdot \$$ into unimodal (LMS) factors
(3) Sort these and relabel them in increasing order

(9) Compute the suffix array of $w^{\prime}$

## Induced-sorting (SA-IS) algorithm ${ }^{[3]}$

Goal: Computing the suffix array of a word $w$ with letters in $\{0,1, \ldots,|w|\}$ or in a finite alphabet

| B | A | L | A | L | A | I | K | A | \$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 4 | 3 | 8 | 2 | 7 | 1 | 5 | 6 | 0 |  |

| 1 |  | $A$ | $L$ | $A$ |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 1 |  |  |  | $A$ | $L$ | $A$ |  |  |  |  |
| 0 |  |  |  |  |  | $A$ | I | K | A | S |

(0) If no symbol of $w$ occurs twice, just sort them
(1) Append a $\$$ symbol (minimal symbol) to $w$
(2) Subdivide $w \cdot \$$ into unimodal (LMS) factors
(3) Sort these and relabel them in increasing order

(gives you w')
(9) Compute the suffix array of $w^{\prime}$
(3) Finish computing the suffix array of $w$

## Induced sorting (SA-IS) algorithm

## Theorem

IS algorithm computes the suffix array of $w$ in time linear in $|w|$.

## Proof elements:

- Steps $1(2$ and $(2)$ can be performed in time $\mathcal{O}(|w|)$
- Unimodal words of total length $\ell$ and their suffixes can be sorted in time $\mathcal{O}(\ell)$ : Steps $\boldsymbol{3}$ and (3) can be performed in time $\mathcal{O}(|w|)$
- Step (4) is performed on a word of length $\left|w^{\prime}\right| \leqslant(|w|-1) / 2$

Suffix array computed in time $\mathcal{O}(|w|+|w| / 2+|w| / 4+\cdots)=\mathcal{O}(|w|)$

## Induced sorting (SA-IS) algorithm

## Theorem

IS algorithm computes the suffix array of $w$ in time linear in $|w|$.

Proof elements:

- Steps $1(2$ and $(2)$ can be performed in time $\mathcal{O}(|w|)$
- Unimodal words of total length $\ell$ and their suffixes can be sorted in time $\mathcal{O}(\ell)$ : Steps $\boldsymbol{3}$ and ( 6 can be performed in time $\mathcal{O}(|w|)$
- Step (4) is performed on a word of length $\left|w^{\prime}\right| \leqslant(|w|-1) / 2$

Suffix array computed in time $\mathcal{O}(|w|+|w| / 2+|w| / 4+\cdots)=\mathcal{O}(|w|)$

## Further questions:

- Can we repeatedly have $\left|w^{\prime}\right|=(|w|-1) / 2$ ?
- What is the reduction ratio $\left|w^{\prime}\right| /|w|$ in practice?
- How many recursive calls shall we expect?

## Reduction ratio: worst case

## Worst-case scenario ${ }^{[5]}$

We can keep having $\left|w^{\prime}\right|=(|w|-1) / 2$ for $\log _{2}(|w|)$ recursive steps

## Example:

$$
\begin{array}{lllllllllllllllll}
2 & 1 & 2 & 0 & 4 & 1 & 4 & 0 & 2 & 1 & 4 & 0 & 4 & 1 & 3 & \$
\end{array}
$$

## Reduction ratio: worst case

Worst-case scenario ${ }^{[5]}$
We can keep having $\left|w^{\prime}\right|=(|w|-1) / 2$ for $\log _{2}(|w|)$ recursive steps

Example:

$$
\begin{array}{ccccccccccccccccc}
2 & 1 & 2 & 0 & 4 & 1 & 4 & 0 & 2 & 1 & 4 & 0 & 4 & 1 & 3 & \$ \\
& 1 & 2 & 0 & & 1 & 4 & 0 & & 1 & 4 & 0 & & 1 & 3 & \$
\end{array}
$$

## Reduction ratio: worst case

## Worst-case scenario ${ }^{[5]}$

We can keep having $\left|w^{\prime}\right|=(|w|-1) / 2$ for $\log _{2}(|w|)$ recursive steps

Example:

$$
\begin{array}{llllllllllllllll}
2 & 1 & 2 & 0 & 4 & 1 & 4 & 0 & 2 & 1 & 4 & 0 & 4 & 1 & 3 & \$ \\
& 2 & & 1 & & 4 & & 0 & & 4 & & 1 & & 3 & & \\
& 1 & 2 & 0 & & 1 & 4 & 0 & & 1 & 4 & 0 & & 1 & 3 & \$ \\
& & & 0 & 4 & 1 & & 0 & 2 & 1 & & 0 & 4 & 1 & &
\end{array}
$$

## Reduction ratio: worst case

## Worst-case scenario ${ }^{[5]}$

We can keep having $\left|w^{\prime}\right|=(|w|-1) / 2$ for $\log _{2}(|w|)$ recursive steps

Example:

$$
\begin{array}{lllllllllllllllll}
2 & 1 & 2 & 0 & 4 & 1 & 4 & 0 & 2 & 1 & 4 & 0 & 4 & 1 & 3 & \$ \\
& 2 & & 1 & & 4 & & 0 & & 4 & & 1 & & 3 & & \\
& 1 & 2 & 0 & & 1 & 4 & 0 & & 1 & 4 & 0 & & 1 & 3 & \$ \\
& & & 0 & 4 & 1 & & 0 & 2 & 1 & & 0 & 4 & 1 & &
\end{array}
$$

Word obtained by applying the increasing morphism

$$
0 \mapsto 02 \quad 1 \mapsto 04 \quad 2 \mapsto 12 \quad 3 \mapsto 13 \quad 4 \mapsto 14
$$

$k$ times on the letter 3, and then deleting the first letter

## Infinitely many independent letters

Sample the letters of $w: \mathbb{Z} \mapsto\{0,1\}$ independently uniformly at random:

Example:
$\begin{array}{lllllllllllllllllll}\ldots & 1 & 0 & 1 & 1 & 0 & 1 & 0 & 1 & 1 & 0 & 0 & 1 & 1 & 0 & 1 & 1 & \ldots\end{array}$

## Infinitely many independent letters

Sample the letters of $w: \mathbb{Z} \mapsto\{0,1\}$ independently uniformly at random:

- Ends of unimodal factors are the subwords 10: $\left|w^{\prime}\right| \sim|w| / 4$

Example:
$\begin{array}{llllllllllllllllll}\ldots & 1 & 0 & 1 & 1 & 0 & 1 & 0 & 1 & 1 & 0 & 0 & 1 & 1 & 0 & 1 & 1 & \ldots \\ \ldots & 1 & 0 & & & 0 & 1 & 0 & & & 0 & 0 & 1 & 1 & 0 & & & \\ & & 0 & 1 & 1 & 0 & & 0 & 1 & 1 & 0 & & & & 0 & 1 & 1 & \ldots\end{array}$

## Infinitely many independent letters

Sample the letters of $w: \mathbb{Z} \mapsto\{0,1\}$ independently uniformly at random:

- Ends of unimodal factors are the subwords $10:\left|w^{\prime}\right| \sim|w| / 4$
- Unimodal factors of $w$ are independent words, with $\mathbb{P}\left[0^{a} 1^{b} 0\right]=2^{-a-b}$

Example:

| $\ldots$ | 1 | 0 | 1 | 1 | 0 | 1 | 0 | 1 | 1 | 0 | 0 | 1 | 1 | 0 | 1 | 1 | $\ldots$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\ldots$ | 1 | 0 |  |  | 0 | 1 | 0 |  |  | 0 | 0 | 1 | 1 | 0 |  |  |  |
|  |  | 0 | 1 | 1 | 0 |  | 0 | 1 | 1 | 0 |  |  |  | 0 | 1 | 1 | $\ldots$ |

## Infinitely many independent letters

Sample the letters of $w: \mathbb{Z} \mapsto\{0,1\}$ independently uniformly at random:

- Ends of unimodal factors are the subwords 10: $\left|w^{\prime}\right| \sim|w| / 4$
- Unimodal factors of $w$ are independent words, with $\mathbb{P}\left[0^{a} 1^{b} 0\right]=2^{-a-b}$
- Infinite alphabet!
(countable, not isomorphic to $\mathbb{Z}$ or $\mathbb{N}$ )

Example:

| $\ldots$ | 1 | 0 | 1 | 1 | 0 | 1 | 0 | 1 | 1 | 0 | 0 | 1 | 1 | 0 | 1 | 1 | $\ldots$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\ldots$ | 1 | 0 |  |  | 0 | 1 | 0 |  |  | 0 | 0 | 1 | 1 | 0 |  |  |  |
|  |  | 0 | 1 | 1 | 0 |  | 0 | 1 | 1 | 0 |  |  |  | 0 | 1 | 1 | $\ldots$ |

$\ldots \quad 0^{1} 1^{2} 0 \quad 0^{2} 1^{2} 0 \quad 0^{1} 1^{1} 0 \quad 0^{2} 1^{1} 0 \quad 0^{2} 1^{2} 0 \quad 0^{2} 1^{2} 0 \quad 0^{3} 1^{1} 0 \quad 0^{1} 1^{4} 0 \quad \ldots$

## Infinitely many independent letters

Sample the letters of $w: \mathbb{Z} \mapsto\{0,1\}$ independently uniformly at random:

- Ends of unimodal factors are the subwords 10: $\left|w^{\prime}\right| \sim|w| / 4$
- Unimodal factors of $w$ are independent words, with $\mathbb{P}\left[0^{a} 1^{b} 0\right]=2^{-a-b}$ - Infinite alphabet!
(countable, not isomorphic to $\mathbb{Z}$ or $\mathbb{N}$ )
- Unimodal factors of $w^{\prime}$ are not independent, and $\left|w^{\prime \prime}\right| \sim 0.353 \ldots\left|w^{\prime}\right|$
- Things keep getting more complicated after further recursive calls

## Example:

| $\ldots$ | 1 | 0 | 1 | 1 | 0 | 1 | 0 | 1 | 1 | 0 | 0 | 1 | 1 | 0 | 1 | 1 | $\ldots$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\ldots$ | 1 | 0 |  |  | 0 | 1 | 0 |  |  | 0 | 0 | 1 | 1 | 0 |  |  |  |
|  |  | 0 | 1 | 1 | 0 |  | 0 | 1 | 1 | 0 |  |  |  | 0 | 1 | 1 | $\ldots$ |

| $\ldots$ | $0^{1} 1^{2} 0$ | $0^{2} 1^{2} 0$ | $0^{1} 1^{1} 0$ | $0^{2} 1^{1} 0$ | $0^{2} 1^{2} 0$ | $0^{2} 1^{2} 0$ | $0^{3} 1^{1} 0$ | $0^{1} 1^{4} 0$ | $\ldots$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\ldots$ | $0^{1} 1^{2} 0$ | $0^{2} 1^{2} 0$ |  | $0^{2} 1^{1} 0$ | $0^{2} 1^{2} 0$ | $0^{2} 1^{2} 0$ | $0^{3} 1^{1} 0$ |  |  |
|  |  | $0^{2} 1^{2} 0$ | $0^{1} 1^{1} 0$ | $0^{2} 1^{1} 0$ |  |  | $0^{3} 1^{1} 0$ | $0^{1} 1^{4} 0$ | $\ldots$ |

## Main challenges

## Questions:

- What about relabelling (in step (2)?
- What about letters that are not independent?
- What when leftmost and rightmost letters are eventually reached?

## Main challenges

## Questions:

- What about relabelling (in step (2)?
- What about letters that are not independent?
- What when leftmost and rightmost letters are eventually reached?

## Answers:

- Relabelling is useful for actual computations, not here
- Assume that letters are given (from left to right or right to left) by a nice Markov chain
- Truncate your Markov chain when you have enough symbols!

## Nice Markov chains

Contraints to satisfy:

- i.i.d. Markov chains are nice
- Unimodular factors of a nice Markov chain are nice
- Ends of unimodular factors must have some density of occurrence

## Nice Markov chains

Contraints to satisfy:

- i.i.d. Markov chains are nice
- Unimodular factors of a nice Markov chain are nice
- Ends of unimodular factors must have some density of occurrence

## EPRI Markov chain ${ }^{[5]}$

A countable Markov chain $M$ is almost surely eventually positive, recurrent and irreducible if it has a terminal component $\mathcal{X}$ that is almost surely reached, and on which $M$ is positive recurrent.

## Nice Markov chains

Contraints to satisfy:

- i.i.d. Markov chains are nice
- Unimodular factors of a nice Markov chain are nice
- Ends of unimodular factors must have some density of occurrence

## EPRI Markov chain ${ }^{[5]}$

A countable Markov chain $M$ is almost surely eventually positive, recurrent and irreducible if it has a terminal component $\mathcal{X}$ that is almost surely reached, and on which $M$ is positive recurrent.

[^0]

## Nice Markov chains

Contraints to satisfy:

- i.i.d. Markov chains are nice
- Unimodular factors of a nice Markov chain are nice
- Ends of unimodular factors must have some density of occurrence

## EPRI Markov chain ${ }^{[5]}$

A countable Markov chain $M$ is almost surely eventually positive, recurrent and irreducible if it has a terminal component $\mathcal{X}$ that is almost surely reached, and on which $M$ is positive recurrent.

Counter-example: $\mathbb{E}[2 \rightarrow 1]=+\infty$

## Nice Markov chains

Contraints to satisfy:

- i.i.d. Markov chains are nice
- Unimodular factors of a nice Markov chain are nice
- Ends of unimodular factors must have some density of occurrence

## EPRI Markov chain ${ }^{[5]}$

A countable Markov chain $M$ is almost surely eventually positive, recurrent and irreducible if it has a terminal component $\mathcal{X}$ that is almost surely reached, and on which $M$ is positive recurrent.

Counter-example: $\mathbb{E}[1 \rightarrow 0]=+\infty$

## Nice Markov chains

Contraints to satisfy:

- i.i.d. Markov chains are nice
- Unimodular factors of a nice Markov chain are nice
- Ends of unimodular factors must have some density of occurrence

## EPRI Markov chain ${ }^{[5]}$

A countable Markov chain $M$ is almost surely eventually positive, recurrent and irreducible if it has a terminal component $\mathcal{X}$ that is almost surely reached, and on which $M$ is positive recurrent.

[^1]

## Letters generated by a nice Markov chain

## Theorem ${ }^{[5]}$

Let $w$ be a word whose letters are generated by an EPRI Markov chain, and let $w^{(k)}$ be the word obtained after $k$ recursive calls. The ratios

$$
\frac{\left|w^{(k)}\right|}{|w|}
$$

converge, in probability, towards a constant $\gamma^{(k)}$.

## Letters generated by a nice Markov chain

## Theorem ${ }^{[5]}$

Let $w$ be a word whose letters are generated by an EPRI Markov chain, and let $w^{(k)}$ be the word obtained after $k$ recursive calls. The ratios

$$
\frac{\left|w^{(k)}\right|}{|w|}
$$

converge, in probability, towards a constant $\gamma^{(k)}$.

## Bonus result ${ }^{[4,5]}$

If the letters of $w$ are i.i.d, $\gamma^{(1)}<1 / 3$.

Number of recursive calls
Step ( 0 (direct letter sorting if possible) is very useful!

## Number of recursive calls

Step © (direct letter sorting if possible) is very useful!

## Theorem ${ }^{[5]}$

Let $w$ be a word whose letters are generated by a finite Markov chain. There exists a constant $k$ such that, for all $\ell \geqslant 0$, the SA-IS algorithm has a probability

$$
\mathbb{P} \leqslant k /|w|^{2^{\ell}}
$$

of performing more than $2 \log _{2}\left(\log _{2}(|w|)\right)+\ell$ recursive calls.

## Number of recursive calls

Step (direct letter sorting if possible) is very useful!

## Theorem ${ }^{[5]}$

Let $w$ be a word whose letters are generated by a finite Markov chain. There exists a constant $k$ such that, for all $\ell \geqslant 0$, the SA-IS algorithm has a probability

$$
\mathbb{P} \leqslant k /|w|^{2^{e}}
$$

of performing more than $2 \log _{2}\left(\log _{2}(|w|)\right)+\ell$ recursive calls.

## Proof elements:

- Each letter of $w^{(i)}$ represents at least $2^{i}$ letters of $w$
- Letters of $w$ reach a terminal component $\mathcal{X}$ in expected time $\mathcal{O}(1)$
- If $\mathcal{X}$ is a cycle, end up with a one-letter word in $\mathcal{O}(1)$ recursive calls
- Otherwise, factors of $w$ of length $2^{\ell}\left(\log _{2}(|w|)\right)^{2}$ are likely to be distinct
