Galloping in fast-growth natural merge sorts

Let us do better!

| 0 | 3 | 4 | 4 | 3 | 2 | 1 | 4 | 3 | 2 | 0 | 5 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

(1) Subdivide your array in monotonic (non-decreasing or decreasing) runs.

## Let us do better!

4 runs of lengths $4,3,4$ and 1

| 0 | 3 | 4 | 4 | 3 | 2 | 1 | 4 | 3 | 2 | 0 | 5 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

(1) Subdivide your array in monotonic (non-decreasing or decreasing) runs.
(2) New parameters: Number of runs $(\rho)$ and their lengths $\left(r_{1}, \ldots, r_{\rho}\right)$

## Let us do better!

4 runs of lengths 4, 3, 4 and 1

| 0 | 3 | 4 | 4 | 3 | 2 | 1 | 4 | 3 | 2 | 0 | 5 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

(1) Subdivide your array in monotonic (non-decreasing or decreasing) runs.
(2) New parameters: Number of runs $(\rho)$ and their lengths $\left(r_{1}, \ldots, r_{\rho}\right)$ Run-length entropy: $\mathcal{H}=\sum_{i=1}^{\rho}\left(r_{i} / n\right) \log _{2}\left(n / r_{i}\right) \leqslant \log _{2}(\rho) \leqslant \log _{2}(n)$

Let us do better!

$$
4 \text { runs of lengths } 4,3,4 \text { and } 1
$$

| 0 | 3 | 4 | 4 | 3 | 2 | 1 | 4 | 3 | 2 | 0 | 5 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

(1) Subdivide your array in monotonic (non-decreasing or decreasing) runs.
(2) New parameters: Number of runs $(\rho)$ and their lengths $\left(r_{1}, \ldots, r_{\rho}\right)$ Run-length entropy: $\mathcal{H}=\sum_{i=1}^{\rho}\left(r_{i} / n\right) \log _{2}\left(n / r_{i}\right) \leqslant \log _{2}(\rho) \leqslant \log _{2}(n)$

## Theorem ${ }^{[5]}$

Powersort uses $\mathcal{O}(n+n \mathcal{H})$ element moves and $\mathcal{O}(n)+n \mathcal{H}$ comparisons.
We cannot do better than $\mathcal{O}(n)+n \mathcal{H}$ comparisons! ${ }^{[4]}$
There are $X$ possible reorderings, with $X \geqslant 2^{1-\rho}\binom{n}{r_{1} \ldots r_{\rho}} \geqslant 2^{(\mathcal{H}-5) n}$.

The principles of Timsort, Trotsort, Powersort et al. Algorithms based on merging adjacent runs

- Stable algorithms (good for composite types)

| 0 | 2 | 2 | 3 | 4 | 0 | 1 | - | 5 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 0 | 0 | 1 | 2 | 2 | 3 | 4 |  |  |

## The principles of Timsort, Trotsort, Powersort et al.

Algorithms based on merging adjacent runs

- Stable algorithms (good for composite types)
(1) Extend small runs to save time $\mathcal{O}(n)$, and make them non-decreasing
(2) Run merging sub-routine: naïve (Trotsort) or optimised (Timsort \& Powersort)
- time $\mathcal{O}(k+\ell)$
- memory $\mathcal{O}(\min (k, \ell))\}$ Merge cost: $k+\ell \geqslant$ \#comparisons
(3) Policy for choosing runs to merge:
- depends on run lengths and positions only

## The principles of Timsort, Trotsort, Powersort et al.

 Algorithms based on merging adjacent runsStable algorithms (good for composite types)

(1) Extend small runs to save time $\mathcal{O}(n)$, and make them non-decreasing
(2) Run merging sub-routine: naïve (Trotsort) or optimised (Timsort \& Powersort)

- time $\mathcal{O}(k+\ell)$
- memory $\mathcal{O}(\min (k, \ell))\}$ Merge cost: $k+\ell \geqslant$ \#comparisons
(3) Policy for choosing runs to merge:
- depends on run lengths and positions only
(3) Complexity analysis:
- Evaluate the total merge cost
- Just work with run lengths

Merge trees and fast growth

Timsort merges

| 0 | 3 | 4 | 4 | 3 | 2 | 1 | 4 | 3 | 2 | 0 | 5 |  |

## Merge trees and fast growth

Timsort merges

Timsort merge branch

## Fast growth and merge cost

## Fast growth ${ }^{[6]}$

An natural merge sort is fast-growing if node sizes grow exponentially fast on its branches:

$$
r_{i+j} \geqslant a^{j-b} \times r_{i} \text { for some constants } a>1 \text { and } b \geqslant 0 .
$$

## Fast growth and merge cost

## Fast growth ${ }^{[6]}$

An natural merge sort is fast-growing if node sizes grow exponentially fast on its branches:

$$
r_{i+j} \geqslant a^{j-b} \times r_{i} \text { for some constants } a>1 \text { and } b \geqslant 0 .
$$

- Each leaf of size $r$ lies at depth $d \leqslant \log _{a}(n / r)+b$.
- Such an algorithm has a merge cost $\leqslant \log _{a}(2) n \mathcal{H}+b n$.

## Fast growth and merge cost

## Fast growth ${ }^{[6]}$

An natural merge sort is fast-growing if node sizes grow exponentially fast on its branches:

$$
r_{i+j} \geqslant a^{j-b} \times r_{i} \text { for some constants } a>1 \text { and } b \geqslant 0 .
$$

- Each leaf of size $r$ lies at depth $d \leqslant \log _{a}(n / r)+b$.
- Such an algorithm has a merge cost $\leqslant \log _{a}(2) n \mathcal{H}+b n$.
- Fast-growing algorithms work in time $\mathcal{O}(n+n \mathcal{H})$.

Examples: Timsort, $\alpha$-Mergesort, Powersort, Peeksort, adaptive Shiverssort

- Powersort performs no more than $n(\mathcal{H}+4)$ comparisons (because $a=2$ and $b=4$ ).
- Peeksort and adaptive Shiverssort perform only $\mathcal{O}(n)+n \mathcal{H}$ comparisons (but a>2).

What about | 0 | 1 | 1 | 0 | 2 | 1 | 0 | 2 | 0 | 2 | 0 | 1 |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :---: | :---: | :---: | :---: | :---: |
| $\downarrow$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

| $5 \times 0$ |  |  | $4 \times 1$ |  |  |  |  | $3 \times 2$ |  |  |  |  |

| 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 |  |  | 2 | 2 |

Few runs vs few values vs few dual runs:

Let us do better, dually!

3 dual runs of lengths 5, 4 and 3

| 0 | 1 | 1 | 0 | 2 | 1 | 0 | 2 | 0 | 2 | 0 | 1 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

(1) Subdivide your data in non-decreasing, non-overlapping dual runs
(2) New parameters: Number of dual runs $\left(\rho^{\star}\right)$ and their lengths $\left(r_{i}^{\star}\right)$

Dual-run entropy: $\mathcal{H}^{\star}=\sum_{i=1}^{\rho^{\star}}\left(r_{i}^{\star} / n\right) \log _{2}\left(n / r_{i}^{\star}\right) \leqslant \log _{2}\left(\rho^{\star}\right) \leqslant \log _{2}(n)$

Let us do better, dually!

## 3 dual runs of lengths 5, 4 and 3

| 0 | 1 | 1 | 0 | 2 | 1 | 0 | 2 | 0 | 2 | 0 | 1 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

(1) Subdivide your data in non-decreasing, non-overlapping dual runs
(2) New parameters: Number of dual runs $\left(\rho^{\star}\right)$ and their lengths $\left(r_{i}^{\star}\right)$

Dual-run entropy: $\mathcal{H}^{\star}=\sum_{i=1}^{\rho^{\star}}\left(r_{i}^{\star} / n\right) \log _{2}\left(n / r_{i}^{\star}\right) \leqslant \log _{2}\left(\rho^{\star}\right) \leqslant \log _{2}(n)$

## Theorem ${ }^{[6]}$

Fast-growing merge sorts require $\mathcal{O}\left(n+n \mathcal{H}^{\star}\right)$ comparisons if they use Timsort's galloping run-merging routine*.
*we are slightly cheating
and we cannot use less than $\mathcal{O}(n)+n \mathcal{H}^{\star}$ comparisons in general.

Galloping merging procedure Merging runs $\approx$ finding an integer (several times) ${ }^{[1,2]}$

| :--- | :--- | :--- | :--- | :--- |

Finding an integer $x$ by asking $y$ and being told whether $y \geqslant x$ :
(1) Ask $y=1,2,3,4 \ldots$
(2) First ask $y=1,2,4,8, \ldots$, then find the bits of $x$

Find $\log _{2}(x)$ with method 1 , then find the bits of $x$
(3) Find $\log _{2}(x)$ with method 2 , then find the bits of $x$

## Galloping merging procedure

Merging runs $\approx$ finding an integer (several times) ${ }^{[1,2]}$

Finding an integer $x$ by asking $y$ and being told whether $y \geqslant x$ :
(1) Ask $y=1,2,3,4 \ldots$
(2) First ask $y=1,2,4,8, \ldots$, then find the bits of $x$

Find $\log _{2}(x)$ with method 1 , then find the bits of $x$
(3) Find $\log _{2}(x)$ with method 2 , then find the bits of $x$

Timsort merging procedure $\approx$ methods $1+2$ with threshold $t^{[2,3]}$ :
(4. Ask $y=1,2, \ldots, \mathrm{t}+1, \mathrm{t}+2, \mathrm{t}+4, \mathrm{t}+8, \ldots$, then find the bits of $x-\mathrm{t}$

- Merge cost: $\sum_{i} \min \left\{\left(1+\mathbf{t}^{-1}\right)\left(k_{\rightarrow i}+\ell_{\rightarrow i}\right), 6 \mathbf{t}+4 \log _{2}\left(k_{\rightarrow i}+\ell_{\rightarrow i}+1\right)\right\} \geqslant$ \#comparisons

## Conclusions (after a few more computations)

- For fixed thresholds t , fast-growth natural merge sorts require $\mathcal{O}\left(n+n \mathcal{H}^{\star}\right)$ comparisons.
- Choosing adequate choices of t , Powersort requires $\mathcal{O}(n)+(1+o(1)) n \mathcal{H}^{\star}$ comparisons. Choose $\mathrm{t} \approx \log (k+\ell)$ to merge runs of lengths $k$ and $\ell$

## Conclusions (after a few more computations)

- For fixed thresholds t , fast-growth natural merge sorts require $\mathcal{O}\left(n+n \mathcal{H}^{\star}\right)$ comparisons.
- Choosing adequate choices of t , Powersort requires $\mathcal{O}(n)+(1+o(1)) n \mathcal{H}^{\star}$ comparisons.

$$
\text { Choose } t \approx \log (k+\ell) \text { to merge runs of lengths } k \text { and } \ell
$$

- Timsort updates t in a way that makes the $\mathcal{O}\left(n+n \mathcal{H}^{\star}\right)$ upper bound look dubious.
- Trotsort requires $\Omega(n \log (n))$ comparisons to sort $010101010101010101 \ldots$

## Conclusions (after a few more computations)

- For fixed thresholds t , fast-growth natural merge sorts require $\mathcal{O}\left(n+n \mathcal{H}^{\star}\right)$ comparisons.
- Choosing adequate choices of t , Powersort requires $\mathcal{O}(n)+(1+o(1)) n \mathcal{H}^{\star}$ comparisons.

$$
\text { Choose } t \approx \log (k+\ell) \text { to merge runs of lengths } k \text { and } \ell
$$

- Timsort updates t in a way that makes the $\mathcal{O}\left(n+n \mathcal{H}^{\star}\right)$ upper bound look dubious.
- Trotsort requires $\Omega(n \log (n))$ comparisons to sort $010101010101010101 .$.
- Studying widely-used algorithms/heuristics rocks!

## Conclusions (after a few more computations) and references

- For fixed thresholds t , fast-growth natural merge sorts require $\mathcal{O}\left(n+n \mathcal{H}^{\star}\right)$ comparisons.
- Choosing adequate choices of t , Powersort requires $\mathcal{O}(n)+(1+o(1)) n \mathcal{H}^{\star}$ comparisons.
